PROJECTS

Newsletter Signup Form

- Developed a newsletter signup form for a fictitious company as a full stack web application.
- The front-end was developed using HTML, CSS, and Bootstrap.
- The back-end was developed using Node.js and Express.js.
- The user inputted data is sent to MailChimp using the MailChimp API, and stored in their database.
- The application was deployed to the internet using Heroku.

MLB Position Player RESTful API

- Created an API with get, post, delete, put, and patch methods designed to aid in storing and organizing player data.
- Developed using Express.js and Node.js. Mongoose was used to create the player model and Body Parser was used to obtain player data.
- Used Postman and Studio 3T to test functionality of the API.
- The player schema was composed of the player's name and team, as well as 8 key statistics.

Wordle Clone

- Developed a multi-file terminal-based Wordle Clone using Python.
- Cleaned a corrupted dictionary text file and organized over 8900 words into a usable file.
- Created a custom class to aid in the functionality of the game.
- Developed an additional feature that provides hints by searching the word dictionary for viable guesses given the user's correctly guessed letters.
